PRC AI ROCK · OPERATING WORKFLOW

Note Taking Agent

From meeting evidence to a dated, reviewable vintage—and a better next meeting.

PRIVATE EVIDENCE → AGENT PRODUCTION

01 / CAPTURE

Meeting sources

- Teams · transcript / recap
- Bee · wearable capture
- Otter.ai · Fireflies.ai*

Whiteboards, photos, screenshots, slides + documents

02 / BOUND + RECONCILE

Canonical evidence

Find the true start and finish, join adjacent captures, reconcile sources, preserve timestamps and flag gaps or unknown speakers.

03 / SYNTHESIZE

Pilot: Hermes + agents

Reconstruct discussion, decisions, open questions, actions and source links. Use prior vintages for continuity—not as substitute evidence.

*Source examples, not a claim of installed connectors. Imagery joins the evidence stack; original context and source references are preserved.

↓

04 / Quality checks + human release gate

Check consequential claims against source; separate decisions from proposals and editorial advice. Apply the authentic brand and ROCK structure. Render HTML/PDF, test mobile, navigation and downloads. Publication or sending requires explicit human authorization.

↓

05 / PACKAGE

A dated meeting vintage

Branded HTML reading edition, matching PDF and action ledger. Preserve prior editions, revisions and private provenance.

06 / PUBLISH + SHARE

Today: Cloudflare + delivery

PRC archive and dated session pages on Pages. Protected editions may use isolated Workers. Verify live content and authorized recipients. Planned next: Azure hosting + Microsoft integration; not deployed.

↰ **The cadence loop:** corrections + open actions + unresolved questions feed the next meeting's preparation. New meetings create new vintages; corrections create revisions of the same vintage.

Pilot built in Hermes. Planned next: a Microsoft-native processing stack using Copilot Studio agents + Azure development—not a plug-and-play runtime swap. Human release approval remains required.
