Action-oriented sales pilot — scoping worksheet

Proposed next phase · planning only · not authority to connect, write or send

1. Product outcome, not another note generator

Use the meeting-assistant pilot as the proof point. Productize the path from evidence to useful, governed outcomes: reviewable follow-up, approved distribution, and verified records in business systems. The pilot was built in Hermes. A Microsoft-native implementation using Copilot Studio agents and Azure development is the proposed next phase, not an implemented runtime swap.

Candidate bounded loop: meeting evidence → canonical account/context record → proposed follow-up and system changes → named human approval → authorized execution → readback and audit. The existing repository implements local evidence validation/rendering, not this external-action loop.

Fill in: business sponsor _____; sales owner _____; integration owner _____; security/data approver _____; pilot users _____; one workflow _____; success measure and baseline _____; explicit exclusions _____.

2. Define the first action product

Choose ONE initial workflow. Prefer read-only context plus unsent drafts before any business-system write.

Candidate	Intended output	Owner / acceptance evidence
Follow-up	Evidence-backed email or task draft; no automatic send	_____
Distribution	Explicit audience, approved content and controlled share	_____
Creatio record	Proposed account/contact match, meeting summary, activity or next step; exact object/fields must be confirmed	_____
Salesloft handoff	Proposed activity/task or follow-up handoff; supported object and permissions must be verified	_____

Decide the authoritative system for each field. A summary is not a verified CRM update. An email draft is not a send. Creating a task must not implicitly enroll a person in a cadence or change opportunity stage.

3. Reusable foundation and integration contract

Keep the application and data definitions above the control-plane discussion. Identify canonical meeting, person, account, evidence, decision and action records; do not assume an existing company schema. Map each proposed write to exact source evidence and a reviewed before/after diff.

The proposed control plane governs approval, execution policy, versions and audit. Agent IT supplies approved context, system connectors, secrets, runtime and operational logs. Improvement loops use corrections, evaluation failures and verified outcomes to revise candidate skills before release.

Fill in: canonical version _____; source system/record IDs _____; identity matching and ambiguity rules _____; authoritative fields _____; conflict/staleness rule _____; approved connector/API/version _____; development/sandbox scope _____.

4. External-action release gates

Gate	Required design / evidence	Owner / status
Identity and scope	Tenant/user/account-level authorization; least privilege; allowed objects and fields; separate read and write permissions	_____
Approval	Exact action, recipients, record target and payload; named approver; expiry; reapproval after edits or stale context	_____
Execution	Allowlisted gateway; unique action/idempotency key; bounded retries; rate-limit handling; no blind replay after uncertain result	_____
Verification	Read back the exact external record or send result; distinguish accepted, delivered, failed and unknown	_____
Audit and recovery	Correlation IDs, reviewed payload/version, outcome evidence, exception owner; supported compensation/rollback or explicit irreversible boundary	_____
Privacy and operations	Data classification, retention/deletion, secret handling, monitoring, incident response and cost owner	_____

Current starter does not implement these production controls. A local reviewed flag is not durable organizational approval. Connector availability, licensing, object permissions and account configuration remain to be verified.

5. Progression and definition of completion

Gate A: synthetic records and negative tests. Gate B: approved read-only real-data pilot. Gate C: human-reviewed proposals with manual execution. Gate D: one tightly scoped, approved write path after gateway, audit and readback tests. Wider rollout is a separate decision.

Test wrong user/tenant/account, ambiguous person match, modified payload after approval, expired approval, duplicate request, timeout after commit, API rate-limit response, concurrent update, partial failure and unavailable readback. An uncertain result stays unresolved until reconciled; never display success merely because a request was sent.

Fill in: entry gate _____; actual test evidence _____; pilot acceptance _____; unresolved gaps _____; authorized release owner/date _____; disable/rollback owner _____; next checkpoint _____.

6. Decisions for Ted, Katie and Jill

Which sales workflow first? Who owns its outcome? Which system is authoritative? What can the agent read, propose or execute? Who approves each external effect? What evidence earns a larger pilot? Agree those boundaries before implementation.

Vendor discovery references, not account verification: Creatio OData overview https://academy.creatio.com/docs/developer/integrations_and_api/data_services/odata/overview ; Salesloft API basics https://developers.salesloft.com/docs/platform/api-basics/ . Verify the actual tenant/product version and permissions before choosing integration mechanisms.
