Group implementation worksheet

Rock Note Taking Agent v0.1 · editable working record · NOT authorization to go live

Use one copy per environment/pilot. Keep completed copies, screenshots and sensitive identifiers in an approved restricted location, not this repository. Never enter passwords, tokens, transcript content or regulated data. Blank means **not verified**, never implicitly approved.

1. Ownership and decision record

Field	Fill in
Group / project / meeting purpose	
Business sponsor and accountable owner	
Implementation lead / backup	
Named evidence reviewer / release approver	
Security, privacy and records approvers	
Tenant admin / Power Platform admin / Teams app admin	
Scope and explicit exclusions	
Acceptance-evidence folder (restricted)	
Review date / next gate / unresolved blockers	

2. Environment, licensing and budget

Field	Fill in
Selected platform / installed runtime version	
Repo approved commit / core and schema versions	
Local sandbox, dev/test/prod boundaries	
Microsoft tenant / environment / solution owner	
Copilot Studio maker role / license / capacity confirmed by	
Teams/Microsoft 365 availability / app policy owner	
Model/provider / account / region / processing approval	
Cost owner / budget / call limits / stop trigger	
Who can use agent, read evidence, review, release	

3. Data and authorization controls

Control	Owner / decision / evidence
Recording consent, transcript rights and approved ingestion window	_____
Data classification and prohibited content	_____
Source export location / canonical-conversion owner / originals retention	_____
Adjacent-source review, exclusion and gap review	_____
Provider processing / residency / subcontractor review	_____
Evidence/draft/artifact access and sharing groups	_____
Retention periods for originals, drafts, artifacts, logs and provider copies	_____
Deletion owner, procedure, backup limits and verification evidence	_____
DLP / audit logging / incident contact and escalation	_____
Human authority and release workflow independent of model tool access	_____

4. Hosted HTTPS vs. local gap – STOP gate

The included server is loopback-only bearer-authenticated development code. It has no TLS, Entra validation, tenant/user RBAC, storage or production hardening. Cloud Copilot cannot call local 127.0.0.1. Never tunnel or expose it. This kit provisions no Cloudflare or Azure service; companion diagram context is not this repo's deployment evidence.

Required for remote pilot	Owner / implemented design / evidence
Approved host, HTTPS certificate and network boundaries	_____
Service implementation/hardening and operational ownership	_____
Identity, meeting-scoped authorization, deny tests	_____
Secret store, rotation and revocation	_____
Request/rate/time bounds, output access and safe logs	_____
Retention/deletion, monitoring, incidents and recovery	_____
Deployed spec host/scheme/security matches actual service	_____
Security approver authorizes remote synthetic-only testing	_____

5. Copilot tools and tenant setup (conditional)

☐ Maker/tenant/environment/solution/license confirmed by named admin.

☐ Current REST API tool preview suitability approved; if policy prohibits preview, STOP.

☐ Approved hosted HTTPS prerequisite complete; no local-dev tunneling.

☐ Deployment-specific Swagger 2 JSON import evidence saved; exact checksum recorded.

☐ Auth mechanism, secure connection and least-privilege identity verified.

☐ Only ingest/validate/render selected; model receives shared instructions/schema.

☐ Payload mapping and response display verified; HTML string is not assumed to be a Teams card.

☐ Wrong credentials, wrong tenant/user and wrong meeting denied by hosted service.

☐ Send/publish/task activation and model release remain unavailable.

Owner / result IDs / blockers: _____

6. Synthetic acceptance before real evidence

Acceptance	**Named tester / date / evidence / pass or fail**
CLI setup, tests and demo on target machine	_____
Source window, gap, unknown identity and original hashes preserved	_____
Draft labels distinguish proposal, agreement, direction and ratification	_____
Unsupported owner/deadline remain unknown; no reconstructed speech	_____
Fabricated quote and unknown ref rejected	_____
Preview escaped; CSV formula protection; sensitive output restricted	_____
Unreviewed release rejected; named human review tested separately	_____
Edition overwrite denied; prior artifacts and manifests retained	_____
Selected runtime discovers skill/tools and invokes actual core	_____
Live model/provider synthetic result reviewed for entailment and injection	_____
Local vs hosted auth/network negative cases and output display	_____

7. Human release and restricted Teams pilot

☐ Evidence reviewer examined boundaries, all claim anchors, omissions and uncertainty.

☐ Authority owner confirmed decision labels; owners and timing reviewed without inference.

☐ Privacy reviewer approved exact output audience/content and retention.

☐ Independent named human release recorded with time/version and evidence location.

☐ Tenant operator published approved agent/version; Teams channel configured.

☐ Named pilot roster and access boundaries verified on actual user accounts.

☐ Organization catalog submission/admin approval/app policy recorded if applicable.

☐ Pilot users confirm correct invocation/output; no source-data over-sharing.

☐ Wider rollout is a separate explicit sponsor/security/admin decision.

Pilot owner / sponsor decision / approval evidence / date: _____

8. Version, rollback and final gate

Field	Fill in
Accepted repo commit / schema / prompt / skill / tool versions	_____
Hosted deployment and deployment-spec checksum	_____
Copilot solution/agent published version and connection owner	_____
Last-known-good version and restricted backups location	_____
Rollback owner / disable access / revoke credentials procedure	_____
Revert deployment + solution/agent + tool spec procedure	_____
Synthetic retest after revert / prior notes remain immutable	_____
Rollback drill evidence and recovery limitations	_____
Final outcome: STOP / synthetic pilot only / real-data pilot approved	_____
Named approvers, date and acceptance evidence	_____

Definition of completion: actual target-platform invocation and negative cases, independent human release, approved audience and retention, and rollback evidence—not a successful import, an install link, a private repo or a passing local demo alone.
